

Consultant Onboarding SOP Manual

Standard Operating Procedures for Deforming and Training Container Instances

CONVERGENCE-AI™ SYSTEMS CORPORATION

Vault-Grade Cryptographic Intelligence Systems

Module 1: Client Pre-Conditions Check

Ensure client target systems satisfy the following prerequisites before provisioning:

1. Active SSL mapping targeting a registered domain (e.g. agent.yourclient.com).
2. Dedicated virtual machine or container environment (minimum 2 vCPU, 4GB RAM).
3. Integration credentials including QuickBooks QuickBooks Developer Client ID, Epic Systems developer portal sign-offs, and Twilio API keys.

Module 2: Licensing and Vertical Lockdowns

To compile a client-ready container instance:

1. Open the Centralized Deployment Hub.
2. Define client branding preferences including logo texts and accent colors.
3. Select the single authorized industry vertical matching their contract.
4. Generate and save the Base64 Activation Token. This token locks down vertical boundaries, rendering other verticals inaccessible to the client UI.

Module 3: Human-in-the-Loop Governance

Consultants must train client administrators on HITL oversight parameters:

1. High-risk transaction nodes (e.g. bank releases or appointment cancellations) route tasks automatically to the verification queue.
2. Revisions requested by the human administrator notify the agent to adjust draft details using NLU feedback loops.
3. Approved transactions can be rolled back using the Reversal History audit log if disputes arise.

Module 4: Live LLM Configuration & AI Compose Gateway Setup

Consultants must perform these steps to enable live cognitive integrations:

1. In the Deployment Hub, navigate to 'Live LLM Integration Gateway'. Select the provider (Gemini, OpenAI, Claude, or local Ollama), select the model version, and enter the API key.
2. Define the reseller markup percentage (e.g. 30%) to enable pass-through transaction billing.
3. Test the connection to verify latency and model handshakes.
4. Instruct operators to click the 'AI Compose' button in the HITL queue. They can review AI-drafted payloads and token cost metrics, edit details, and click 'Apply to Task' to update details.
